(54) Title: INHIBITOR OF VASCULAR ENDOTHELIAL CELL GROWTH FACTOR			
(57) Abstract  The vascular endothelial cell growth factor (VEGF) inhibitors of the present invention are naturally occurring or recombinantly engineered soluble forms with or without a C-terminal transmembrane region of the receptor for VEGF, a very selective growth factor for endothelial cells. The soluble forms of the receptors will bind the growth factor with high affinity but do not result in signal transduction. These soluble forms of the receptor bind VEGF and inhibit its function.

10 TITLE OF THE DISCLOSURE  
INHIBITOR OF VASCULAR ENDOTHELIAL CELL GROWTH FACTOR

BACKGROUND OF THE DISCLOSURE

15 Recently a new class of cell-derived dimeric  
mitogens with selectivity for vascular endothelial  
cells has been identified and designated vascular  
endothelial cell growth factor (VEGF). VEGF has been  
purified from conditioned growth media of rat glioma  
cells [Conn et al., (1990), Proc. Natl. Acad. Sci.  
20 U.S.A., 87, pp 2628-2632]; and conditioned growth media  
of bovine pituitary folliculo stellate cells [Ferrara  
and Henzel, (1989), Biochem. Biophys. Res. Comm., 161,  
pp. 851-858; Gozpadorowicz et al., (1989), Proc. Natl.  
Acad. Sci. U.S.A., 86, pp. 7311-7315] and conditioned  
25 growth medium from human U937 cells [Connolly, D. T. et  
al. (1989), Science, 246, pp. 1309-1312]. VEGF is a  
dimer with an apparent molecular mass of about 46 kDa  
with each subunit having an apparent molecular mass of  
about 23 kDa.

30

- 2 -

VEGF has some structural similarities to platelet derived growth factor (PDGF), which is a mitogen for connective tissue cells but not mitogenic for vascular  
5 endothelial cells from large vessels.

The membrane-bound tyrosine kinase receptor, known as FLT, was shown to be a VEGF receptor [DeVries, C. *et al.*, (1992), *Science*, 255, pp.989-991]. The FLT receptor specifically binds VEGF which induces  
10 mitogenesis. Another form of the VEGF receptor, designated KDR, is also known to bind VEGF and induce mitogenesis. The partial cDNA sequence and nearly full length protein sequence of KDR is known as well [Terman, B.I. *et al.*, (1991) *Oncogene* 6, pp. 1677-1683;  
15 Terman, B.I. *et al.*, (1992) *Biochem. Biophys. Res. Comm.* 187, pp. 1579-1586].

Persistent angiogenesis may cause or exacerbate certain diseases such as psoriasis, rheumatoid arthritis, hemangiomas, angiofibromas,  
20 diabetic retinopathy and neovascular glaucoma. An inhibitor of VEGF activity would be useful as a treatment for such diseases and other VEGF-induced pathological angiogenesis and vascular permeability conditions, such as tumor vascularization.

25

#### SUMMARY OF THE DISCLOSURE

A naturally-occurring FLT messenger RNA (mRNA) was identified and cloned from vascular endothelial cells. This mRNA is shown to encode most  
30 of the extracellular, or soluble, portion of the VEGF receptor, FLT. Soluble receptor molecules including

- 3 -

forms containing a C-terminal transmembrane region are also recombinantly engineered for this and other VEGF receptors. These soluble receptors, comprising  
5 truncated and modified forms are expressed in recombinant host cells and have VEGF binding properties. The soluble receptor proteins are useful as inhibitors of VEGF activity since they will bind  
10 available VEGF preventing it from activating its functional receptors on vascular endothelial cells and could form non-functional heterodimers with full-length membrane anchored VEGF receptors.

#### BRIEF DESCRIPTION OF THE DRAWINGS

#### DETAILED DESCRIPTION OF THE DISCLOSURE

The present invention relates to cDNA  
20 encoding a soluble VEGF receptor protein (sVEGF-R)  
which is isolated from VEGF receptor producing cells or  
is recombinantly engineered from VEGF receptor-encoding  
DNA. sVEGF-R, as used herein, refers to a protein  
which can specifically bind to a vascular endothelial  
25 cell growth factor without stimulating mitogenesis of  
vascular endothelial cells.

The amino acid sequence of FLT is known,  
[Shibuya, M. *et al.*, (1990), *Oncogene*, 5, pp.519-524]  
and corresponds to the full length cell-associated VEGF  
30 tyrosine kinase receptor. Other VEGF receptors are  
known to exist. Other known VEGF receptors include,

- 6 -

but are not limited to KDR [Terman (1991), supra., and Terman (1992), supra.]. Mammalian cells capable of producing FLT, KDR and other VEGF receptors include, but are not limited to, vascular endothelial cells. Mammalian cell lines which produce FLT or KDR and other VEGF receptors include, but are not limited to, human endothelial cells. The preferred cells for the present invention include human umbilical vein endothelial cells (HUVEC).

Other cells and cell lines may also be suitable for use to isolate sVEGF-R cDNA. Selection of suitable cells may be done by screening for sVEGF-R binding activity on cell surfaces, in cell extracts or conditioned medium or by screening for gene expression by PCR or hybridization. Methods for detecting soluble receptor activity are well known in the art [Duan, D-S. R. *et al.*, (1991) J.Biol.Chem., 266, pp.413-418] and measure the binding of labelled VEGF. Cells which possess VEGF binding activity in this assay may be suitable for the isolation of sVEGF-R cDNA.

Full length FLT producing cells such as human HUVEC cells (American Type Culture Collection, ATCC CRL 1730) [Hoshi, H. and McKeehan, W.L., Proc. Natl. Acad. Sci. U.S.A., (1984) 81, pp. 6413-6417] are grown according to the recommended culture conditions of the ATCC. Full length FLT, and KDR VEGF receptors as well as extracellular region (sVEGF-RI and sVEGF-RII) and extracellular region plus transmembrane region forms (sVEGF-RTMI and sVEGF-RTMII) are shown in Figure 1. The full length receptor has an extracellular ligand

- 7 -

binding region composed of about seven immunoglobulin-like domains, a membrane spanning sequence (transmembrane domain) and intracellular tyrosine kinase domains. The inhibitory forms of this receptor, which are the subject of the present invention, are also shown in Figure 1 and lack the intracellular kinase domains, and for some inhibitors, the transmembrane sequence and the C-terminal most Ig-like extracellular domain.

Any of a variety of procedures may be used to molecularly clone sVEGF-R cDNA. These methods include, but are not limited to, direct functional expression of the sVEGF-R gene following the construction of an sVEGF-R-containing cDNA library in an appropriate expression vector system.

Another method is to screen a sVEGF-R-containing cDNA library constructed in a bacteriophage or plasmid shuttle vector with a labelled oligonucleotide probe designed from the predicted amino acid sequence of sVEGF-R. The preferred method consists of screening a sVEGF-R-containing cDNA library constructed in a bacteriophage or plasmid shuttle vector with a partial cDNA encoding at least part of the full length FLT protein. This partial cDNA is obtained by the specific PCR amplification of sVEGF-R DNA fragments through the design of oligonucleotide primers from the known sequence of the full length FLT-encoding DNA.

It is readily apparent to those skilled in the art that other types of libraries, as well as

- 8 -

libraries constructed from other cells or cell types, may be useful for isolating sVEGF-R-encoding DNA. Other types of libraries include, but are not limited to, cDNA libraries derived from other cells or cell lines other than HUVECs and genomic DNA libraries.

It is readily apparent to those skilled in the art that suitable cDNA libraries may be prepared from cells or cell lines which have sVEGF-R activity. The selection of cells or cell lines for use in preparing a cDNA library to isolate sVEGF-R cDNA may be done by first measuring secreted sVEGF-R activity using the VEGF binding assay described fully herein.

Preparation of cDNA libraries can be performed by standard techniques well known in the art. Well known cDNA library construction techniques can be found for example, in Maniatis, T., Fritsch, E.F., Sambrook, J., Molecular Cloning: A Laboratory Manual (Cold Spring Harbor Laboratory, Cold Spring Harbor, New York, 1982).

It is also readily apparent to those skilled in the art that DNA encoding sVEGF-R may also be isolated from a suitable genomic DNA library. Construction of genomic DNA libraries can be performed by standard techniques well known in the art. Well known genomic DNA library construction techniques can be found in Maniatis, T., Fritsch, E.F., Sambrook, J. in Molecular Cloning: A Laboratory Manual (Cold Spring Harbor Laboratory, Cold Spring Harbor, New York, 1982).

Another means of obtaining sVEGF-R molecules is to recombinantly engineer them from DNA encoding the

- 9 -

partial or complete amino acid sequence of a VEGF receptor. Examples of other VEGF receptors include, but are not limited to, KDR. Using recombinant DNA techniques, DNA molecules are constructed which encode at least a portion of the VEGF receptor capable of binding VEGF without stimulating mitogenesis. Standard recombinant DNA techniques are used such as those found in Maniatis, et al., supra.

Using one of the preferred methods of the present invention, cDNA clones encoding sVEGF-R are isolated in a two-stage approach employing polymerase chain reaction (PCR) based technology and cDNA library screening. In the first stage, DNA oligonucleotides derived from the extracellular domain sequence information from the known full length FLT, KDR or other VEGF receptor is used to design degenerate oligonucleotide primers for the amplification of sVEGF-R-specific DNA fragments. In the second stage, these fragments are cloned to serve as probes for the isolation of complete sVEGF-R cDNA from a commercially available lambda gt10 cDNA library (Clontech) derived from HUVEC cells (ATCC CRL 1730).

These PCR derived products were used as hybridization probes for screening a lambda gt10 cDNA library derived from HUVECs (Clontech). Plating and plaque lifts of the library were performed by standard methods (T. Maniatis, E.F. Fritsch, J. Sambrook, Molecular Cloning: A Laboratory Manual (Cold Spring Harbor Laboratory, Cold Spring Harbor, New York, 1982)). The probes were random-primed labelled with

- 10 -

32P-dCTP to high specific activity and a separate screening of the library ( $1 \times 10^6$  plaques per screen) was conducted with each probe. The probes were  
5 added to hybridization buffer (50% formamide, 5X Denhardt's, 6X SSC (1X SSC = 0.15 M NaCl, 0.015 M Na<sub>3</sub>citrate·2H<sub>2</sub>O, pH 7.0), 0.1% SDS, 100 µg/ml salmon sperm DNA) at  $1 \times 10^6$  cpm/ml.

Four positively hybridizing phage were  
10 detected using the flt-specific probe. These positively hybridizing phage were observed to be less than full length flt.

Two flt cDNA clones of about 2.0 kb and 2.7 kb in length were subcloned into pGEM vectors (Promega)  
15 and bi-directionally sequenced in their entirety by the chain termination method (Sanger *et al.*, (1977) P.N.A.S. USA, 74, pp. 5463-5467,) and shown to contain a single open reading frame of about 569 amino acids. Sequence analysis demonstrated that a portion of the 5'  
20 flt coding region was missing from these clones. The remainder of the 5' end was cloned using PCR and combined with the DNA of the clones lacking the 5' end to yield a single open reading frame encoding about 687 amino acids.

25 The sequence for the cDNA encoding flt-derived sVEGF-RI is shown in Table 1, and was identified in clones 7 and 11. The deduced amino acid sequence of sVEGF-RI from the cloned cDNA is shown in Table 2. Inspection of the deduced amino acid sequence  
30 reveals the presence of a single, large open reading frame of 687 amino acids. By comparison with amino

- 11 -

acid sequence of the full length FLT VEGF receptor, 31 amino acids are encoded at the C-terminal end of the cDNA which are different from those of FLT.

5           Using another of the preferred methods of the present invention, DNA encoding sVEGF-R is constructed from a DNA sequence encoding a VEGF receptor. For purposes of illustration, DNA encoding the VEGF receptor known as KDR was utilized. Using the receptor  
10 DNA sequence, a DNA molecule is constructed which encodes the extracellular domain of the receptor, or the VEGF binding domain only and is denoted sVEGF-RII. Restriction endonuclease cleavage sites are identified within the receptor DNA and can be utilized directly to  
15 excise the extracellular-encoding portion. In addition, PCR techniques as described above may be utilized to produce the desired portion of DNA. It is readily apparent to those skilled in the art that other techniques, which are standard in the art, may be  
20 utilized to produce sVEGF-R molecules in a manner analagous to those described above. Such techniques are found, for example, in Maniatis et al., supra.

          Additional truncated forms of the VEGF receptor are constructed which contain the  
25 transmembrane region. Retention of the transmembrane may facilitate orientation of the inhibitor molecule at the target cell surface. Examples of transmembrane region containing inhibitor molecules include but are not limited to those shown in Figure 1. sVEGF-RTMI and  
30 sVEGF-RTMII, as shown in Figure 1, are FLT-related and KDR-related, respectively, transmembrane region

- 12 -

containing receptor inhibitors. Construction of transmembrane region containing molecules, such as sVEGF-RTMI and sVEGF-RTMII, is done by standard techniques known in the art including but not limited to utilizing convenient restriction endonuclease cleavage sites or PCR techniques as described herein. It is readily understood by those skilled in the art that various forms of the inhibitors of a VEGF receptor, as disclosed herein, containing only the extracellular region or containing, in addition, the transmembrane region may be constructed which have substantially the same activity.

The cloned sVEGF-R cDNA obtained through the methods described above may be recombinantly expressed by molecular cloning into an expression vector containing a suitable promoter and other appropriate transcription regulatory elements, and transferred into prokaryotic or eukaryotic host cells to produce recombinant sVEGF-R. Techniques for such manipulations are fully described in Maniatis, T, et al., supra, and are well known in the art.

Expression vectors are defined herein as DNA sequences that are required for the transcription of cloned copies of genes and the translation of their mRNAs in an appropriate host. Such vectors can be used to express eukaryotic genes in a variety of hosts such as bacteria, bluegreen algae, fungal cells, yeast cells, plant cells, insect cells and animal cells.

Specifically designed vectors allow the shuttling of DNA between hosts such as bacteria-yeast

- 13 -

or bacteria-animal or bacteria-insect cells. An appropriately constructed expression vector should contain: an origin of replication for autonomous  
5 replication in host cells, selectable markers, a limited number of useful restriction enzyme sites, a potential for high copy number, and active promoters. A promoter is defined as a DNA sequence that directs RNA polymerase to bind to DNA and initiate RNA  
10 synthesis. A strong promoter is one which causes mRNAs to be initiated at high frequency. Expression vectors may include, but are not limited to, cloning vectors, modified cloning vectors, specifically designed plasmids or viruses.

15 A variety of mammalian expression vectors may be used to express recombinant sVEGF-R in mammalian cells. Commercially available mammalian expression vectors which may be suitable for recombinant sVEGF-R expression, include but are not limited to, pMC1neo  
20 (Stratagene), pXT1 (Stratagene), pSG5 (Stratagene), EBO-pSV2-neo (ATCC 37593) pBPV-1(8-2) (ATCC 37110), pdBPV-MMTneo(342-12) (ATCC 37224), pRSVgpt (ATCC 37199), pRSVneo (ATCC 37198), pSV2-dhfr (ATCC 37146), pUCTag (ATCC 37460), and gZD35 (ATCC 37565).

25 DNA encoding sVEGF-R may also be cloned into an expression vector for expression in a recombinant host cell. Recombinant host cells may be prokaryotic or eukaryotic, including but not limited to bacteria, yeast, mammalian cells including but not limited to  
30 cell lines of human, bovine, porcine, monkey and rodent origin, and insect cells including but not limited to

- 14 -

drosophila, moth, mosquito and armyworm derived cell lines. Cell lines derived from mammalian species which may be suitable and which are commercially available, include but are not limited to, CV-1 (ATCC CCL 70), COS-1 (ATCC CRL 1650), COS-7 (ATCC CRL 1651), CHO-K1 (ATCC CCL 61), 3T3 (ATCC CCL 92), NIH/3T3 (ATCC CRL 1658), HeLa (ATCC CCL 2), C127I (ATCC CRL 1616), BS-C-1 (ATCC CCL 26) and MRC-5 (ATCC CCL 171). Insect cell lines which may be suitable and are commercially available include but are not limited to 3M-S (ATCC CRL 8851) moth (ATCC CCL 80) mosquito (ATCC CCL 194 and 195; ATCC CRL 1660 and 1591) and armyworm (Sf9, ATCC CRL 1711).

The expression vector may be introduced into host cells via any one of a number of techniques including but not limited to transformation, transfection, liposome or protoplast fusion, and electroporation. The expression vector-containing cells are clonally propagated and individually analyzed to determine whether they produce sVEGF-R protein. Identification of sVEGF-R expressing host cell clones may be done by several means, including but not limited to immunological reactivity with anti-sVEGF-R antibodies, binding to radiolabelled VEGF, and the presence of host cell-secreted sVEGF-R activity.

Expression of sVEGF-R DNA may also be performed using *in vitro* produced synthetic mRNA. Synthetic mRNA can be efficiently translated in various cell-free systems, including but not limited to wheat germ extracts and reticulocyte extracts, as well as

- 15 -

efficiently translated in cell based systems, including but not limited to microinjection into frog oocytes, with microinjection into frog oocytes being preferred.

5           Levels of sVEGF-R protein produced by host cells may be quantitated by immunoaffinity and/or ligand affinity techniques. sVEGF-R-specific affinity beads or sVEGF-R-specific antibodies are used to isolate <sup>35</sup>S-methionine labelled or unlabelled sVEGF-R  
10 protein. Labelled sVEGF-R protein is analyzed by SDS-PAGE. Unlabelled sVEGF-R protein is detected by Western blotting, ELISA or RIA assays employing sVEGF-R specific antibodies, or by ligand blotting with labelled VEGF.

15           Following expression of sVEGF-R in a recombinant host cell, sVEGF-R protein may be recovered to provide sVEGF-R in active form, capable of binding VEGF without stimulating mitogenesis. Several sVEGF-R purification procedures are available and suitable for  
20 use. sVEGF-R may be purified from cell lysates and extracts, or from conditioned culture medium, by various combinations of, or individual application of salt fractionation, ion exchange chromatography, size exclusion chromatography, hydroxylapatite adsorption  
25 chromatography, reversed phase chromatography, heparin sepharose chromatography, VEGF ligand affinity chromatography, and hydrophobic interaction chromatography.

          In addition, recombinant sVEGF-R can be  
30 separated from other cellular proteins by use of an immuno-affinity column made with monoclonal or

- 16 -

polyclonal antibodies specific for full length sVEGF-R, or polypeptide fragments of sVEGF-R.

- 5    Identification of sVEGF-RI - In an attempt to clone the VEGF receptor cDNA (flt) a HUVEC  $\lambda$ gt10 cDNA library was screened with a DNA probe derived from the extracellular domain of the membrane bound or full length form of this receptor as shown in Figure 1.
- 10 Four incomplete clones, all lacking various lengths of 5' coding sequence, were isolated from screening a total of  $1 \times 10^6$  plaques. Two of these isolates represent partial clones that were identical to full length flt, one of which contained the complete 3'
- 15 coding region of the form described by Shibuya *et al.*, supra. The other two clones were identical to full length flt up to base pair number 2219 (Table 1 and Figure 2) where they then diverged from full length flt. These clones (clone 7 and 11) coded for an
- 20 additional unique 31 amino acids before the open reading frame is terminated by a TAA codon (Table 2 and Figure 3).

Clone 7 and 11 coded for a protein with a predicted molecular mass of about 75 kDa containing 12

25 putative N-linked glycosylation sites. This version of the receptor was missing the transmembrane and intracellular kinase domains and thus coded for a natural soluble form of the VEGF receptor (sVEGF-RI). Further, the protein molecule predicted by sVEGF-RI has

30 only the first six Ig-like domains, missing the one closest to the transmembrane sequence (Figure 1). The

- 17 -

31 amino acids at the C-terminal end of sVEGF-RI contain two cysteine residues, but does not resemble an Ig domain.

5

Expression of sVEGF-RI in Sf9 cells - To analyze the binding and biological properties of this form of the receptor, the protein was expressed using a baculovirus expression system. Clone 7 was missing about 350 base  
10 pairs of coding sequence at the 5' end. This region was cloned by PCR using the primers described above and in Example 1. A clone containing the complete coding region of sVEGF-RI was constructed by combining the 5' PCR fragment with sVEGF-RI clone 7 which overlapped at  
15 a SacI site. The 5' EcoRI site was then changed to a BamHI site and the full length sVEGF-RI was cloned into pBluebac III (Invitrogen) as a BamHI/BamHI fragment. A recombinant baculovirus P-3 stock containing the sVEGF-RI gene 3' in relation to the polyhedrin promoter  
20 was then prepared as described herein.

Culture media from small scale infections were tested for the ability to form high molecular weight complexes with [ $^{125}$ I]VEGF. The labeled ligand and culture media from the baculovirus infected cells  
25 were combined and incubated. The reactions were then analyzed by size exclusion chromatography. When the wild-type infected culture medium was mixed with the radioactive ligand (Figure 4) a single radioactive peak was observed. However, when the sVEGF-RI infected  
30 culture medium was used, a high molecular weight complex was formed, as evident by the appearance of a

- 18 -

second peak in this reaction eluting near the void volume of the column. This experiment showed that the natural soluble form of the FLT VEGF receptor,  
5 sVEGF-RI, forms a high molecular weight complex with VEGF.

The recombinantly produced sVEGF-R is purified from the recombinant host cell extracts or cell culture fluid using heparin-sepharose column  
10 chromatography which specifically binds the sVEGF-R protein. The heparin-sepharose bound VEGF-R column is washed using a suitable buffer containing between 0.1M and 0.6M NaCl which removes contaminating proteins without significant loss of sVEGF-R. The sVEGF-R is  
15 eluted from the heparin-sepharose column using a suitable buffer containing about 1M NaCl, yielding substantially purified sVEGF-R.

Binding of the sVEGF-RI to VEGF - The binding of  
20  $^{125}\text{I}$ -labelled VEGF to sVEGF-RI was characterized by crosslinking, and by complex formation with sVEGF-RI absorbed to 96 well plates.

The crosslinked products are shown in Figure 6. The sVEGF-RI was cross-linked to [ $^{125}\text{I}$ ]VEGF (lane  
25 1); in the presence of unlabelled VEGF (lane 2) and unlabelled bFGF (lane 3). Two high molecular weight bands (about 145 kDa and 245 kDa) were formed in the sVEGF-RI and [ $^{125}\text{I}$ ]VEGF containing reaction, and in the sVEGF-RI and [ $^{125}\text{I}$ ]VEGF plus an excess of unlabelled  
30 bFGF reaction. The two high molecular weight bands were not present when sVEGF-RI was

- 19 -

incubated with [ $^{125}$ I]VEGF plus an excess of unlabelled VEGF, demonstrating the specificity of sVEGF-RI for VEGF, and the ability of sVEGF-RI to form a dimer. The  
5 145 kDa band is presumably a crosslinked complex containing one receptor molecule (about 100 kDa) and a VEGF dimer (about 46 kDa). As shown in Figure 6 complexes containing two receptor molecules (about 245 kDa) were also observed. This suggests that each VEGF  
10 dimer can bind one or two receptor molecules and that the soluble form of the VEGF receptor may undergo ligand-induced dimerization.

The affinity of sVEGF-RI for VEGF was evaluated by absorbing sVEGF-RI to the surface of a 96  
15 well plate, followed by blocking the nonspecific sites with 0.5% gelatin. Variable amounts of labeled ligand were added to each well. These results demonstrate that sVEGF-RI binds VEGF with high affinity with an apparent  $K_d$  of about 20pM (Figure 7). Since the  
20 soluble form of the receptor is missing the Ig domain closest to the transmembrane spanning region, this domain is not required for ligand binding.

The sVEGF-RI is shown to inhibit binding of VEGF to HUVECs by incubating cultured HUVECs with  
25 [ $^{125}$ I]VEGF and various amounts of sVEGF-RI. Following incubation, the cells are washed to remove unbound [ $^{125}$ I]VEGF. The cells are then solubilized and the amount of cell-associated  $^{125}$ I is determined by gamma  
30 counter, which demonstrates the amount of [ $^{125}$ I]VEGF which was capable of binding to the cellular VEGF receptor in the presence of sVEGF-RI. Using this

- 20 -

method, it is demonstrated that sVEGF-RI was capable of inhibiting [ $^{125}\text{I}$ ]VEGF binding to HUVECs VEGF receptor (see Figure 8).

5           Since sVEGF-RI was able to inhibit VEGF binding to cell receptors, it was then determined that sVEGF-RI could inhibit VEGF induced mitogenesis. Cells are preincubated with sVEGF-RI and then incubated with VEGF in the presence of [ $^3\text{H}$ ]thymidine. Following  
10 incubation, the amount of cellular DNA-incorporated [ $^3\text{H}$ ]thymidine is measured which indicates whether VEGF has induced mitogenesis and caused [ $^3\text{H}$ ]thymidine to be incorporated into cellular DNA. The presence of sVEGF-RI inhibits the ability of VEGF to stimulate  
15 mitogenesis as shown in Figure 9.

          The inhibitor of the present invention can be used for the inhibition of VEGF activity. The inhibitor can be used either topically or intravascularly. For topical applications the  
20 formulation would be applied directly at a rate of about 10 ng to about 1 mg/cm<sup>2</sup>/day. For intravaneous applications, the inhibitor is used at a rate of about 1 µg to about 10 mg/kg/day of body weight. For internal use, the formulation may be released directly  
25 into the region to be treated either from implanted slow release polymeric material or from slow release pumps or repeated injections. The release rate in either case is about 100 ng to about 100 µg/day/cm<sup>3</sup>.

          For non-topical application the VEGF  
30 inhibitor is administered in combination with pharmaceutically acceptable carriers or diluents such

- 21 -

as phosphate buffer, saline, phosphate buffered saline, Ringer's solution, and the like, in a pharmaceutical composition, according to standard pharmaceutical practice. For topical application, various pharmaceutical formulations are useful for the administration of the active compound of this invention. Such formulations include, but are not limited to, the following: ointments such as hydrophilic petrolatum or polyethylene glycol ointment; pastes which may contain gums such as xanthan gum; solutions such as alcoholic or aqueous solutions; gels such as aluminum hydroxide or sodium alginate gels; albumins such as human or animal albumins; collagens such as human or animal collagens; celluloses such as alkyl celluloses, hydroxy alkyl celluloses and alkylhydroxyalkyl celluloses, for example methylcellulose, hydroxyethyl cellulose, carboxymethyl cellulose, hydroxypropyl methylcellulose, and hydroxypropyl cellulose; polyoxamers such as Pluronic® Polyols exemplified by Pluronic® F-127; tetronics such as tetronic 1508; and alginates such as sodium alginate.

The following examples are provided as illustrative of the present invention without, however, limiting the same thereto.

#### EXAMPLE 1

Cloning flt-related sVEGF-RI - A 580 base pair DNA probe for flt was obtained by PCR of the HUVEC phage library using the primers 5' GCACCTTGTTGTGGCTGAC 3'

- 22 -

(SEQ. ID. No.: 1) and 5' TGGAATTCGTGCTGCTTCCTGGTCC  
3'(SEQ. ID. No.: 2). The resulting DNA fragment was  
cloned into pGEM3Z as a XbaI/EcoRI fragment. The  
5 probe was prepared by the random priming method  
[Feinberg, A.P. and Vogelstein, B., (1983)  
Anal.Biochem., 132, pp.6-13] using the megaprime kit  
(Amersham) at a specific activity of  $1 \times 10^7$  cpm/ng.  
The HUVEC cDNA library was plated at a density of  $5 \times$   
10  $10^4$  plaques/150 cm plate then about  $1 \times 10^6$  plaques  
were screened by hybridization as previously described  
[Maniatis, T. *et al.*, supra]. Briefly, following  
prehybridization at 42°C for 2 hours in 50% formamide,  
5X SSC, 5X Denhardt's solution, 0.1% SDS, 100 µg/ml  
15 salmon sperm DNA (hybridization buffer) the filters  
were hybridized with the probe for 16 hours at 42°C in  
hybridization buffer. The filters were washed one  
time for 15 min at room temperature in 2X SSC then  
three times at 55°C in 0.1 X SSC. Four positive  
20 plaques were identified and rescreened two additional  
times to obtain homogeneous isolates. Inserts were  
cloned into pGEM3Z for DNA sequence analysis. Two of  
these clones were identified which contained less than  
the full length flt coding region. DNA sequence  
25 analysis showed that these clones lacked the 5' coding  
region of flt. The DNA sequence is shown in Table 1  
and Figure 2, and the deduced amino acid sequence is  
shown in Table 2 and Figure 3. The 5' end of flt was  
cloned by PCR using the primers 5'  
30 GGAATTCGCGCTCACCATGGTCAGC 3' (SEQ.ID.NO.:3) and 5'  
TTTGAATTCACCCGGCAGGGAATGACG 3' (SEQ.ID.NO.:4). The  
PCR fragment generated with this set of primers was  
cloned into flt clone 7 as an EcoRI/SacI fragment.

## EXAMPLE 2

Expression of sVEGF-RI in Sf9 insect cells - The full  
20 length sequence encoding sVEGF-RI was cloned as an  
EcoRI/BamHI fragment into pGEM3Z. The EcoRI site was  
then modified to a BamHI site and cloned into pBlueBac  
III 3' of the polyhedrin promoter (psFLTblue). This  
plasmid was transfected into Sf9 armyworm cells using  
25 liposomes. After 48 hours the medium from the  
transfected cells which contains recombinant polyhedrin  
virus particles, was harvested. Dilutions ( $10^3$  -  $10^4$   
fold) of the virus were prepared and plaque purified in  
soft agar containing 150 µg/ml 5-bromo-4-chloro-3-  
30

- 34 -

indolyl- $\beta$ -D-galactoside. Recombinant plaques were identified by blue color and used to infect Sf9 cells ( $5 \times 10^5$  cells/well) in 12 well plates. Medium (100  $\mu$ l) from polyhedrin minus infections was used to prepare P-2 viral stocks by infecting  $2.5 \times 10^6$  cells in a T-25 flask. Large scale high titer P-3 viral stocks were then prepared by infecting Sf9 cells (500 ml at  $2 \times 10^6$  cells/ml) with 5 ml of the P-2 stock then incubating at 27°C for 5 - 6 days and the medium was harvested by centrifugation. Protein expression was accomplished by infecting cells at a density of  $2 - 2.5 \times 10^6$  cells/ml with a multiplicity of infection of 5 - 10. Twenty four hours after infection the cells were changed to a serum free medium (SF900II, Gibco BRL), incubated for an additional 48 hours and the medium was collected. This conditioned medium contains the recombinantly expressed sVEGF-RI protein.

20

EXAMPLE 3

Iodination of VEGF -  $^{125}\text{I}$ -labeled human recombinant VEGF was prepared by the chloramine T method (Hunter, W.M. and Greenwood, F.C., (1962) Nature (London), 194, pp. 495-496). Briefly, 1  $\mu$ g of VEGF in 30% acetonitrile/0.1% trifluoroacetic acid was adjusted to pH 7.1 by the addition of 1/3 volume of 0.4 M sodium phosphate buffer, pH 7.1. Freshly dissolved chloramine T (4  $\mu$ l of a 2 mg/ml stock in 0.1 M sodium phosphate buffer, pH 7.1) was added to the VEGF solution and reacted for 45 seconds at room temperature (total

- 35 -

volume of 150  $\mu$ l). The reaction was stopped by the addition of 50  $\mu$ l of 10 mM KI and 50  $\mu$ l of 2 mg/ml meta bisufite. The labeled ligand was separated from the free  $^{125}\text{I}$  by gel filtration on a 0.7 X 15 cm Sephadex G-25 column equilibrated in PBS with 1 mg/ml gelatin. Fractions were counted in a Packard  $\gamma$  counter, aliquoted and stored at  $-70^\circ\text{C}$ . VEGF was labeled to a specific activity of  $5 \times 10^5$  to  $1 \times 10^6$  cpm/ng.

Gel Filtration Chromatography - Receptor-ligand complex was formed by incubating 10  $\mu$ l of  $^{125}\text{I}$ -labeled VEGF ( $10^5$  cpm) with 100  $\mu$ l of either wild-type or baculovirus sVEGF-RI-containing, infected Sf9 cell culture medium overnight at room temperature. The reaction products were separated on a Sephacryl S200 gel filtration column (0.7 X 25 cm) equilibrated in PBS, 1 mg/ml gelatin, at a flow rate of 15 ml/hr. Fractions (0.75 ml) were collected and analyzed in a  $\gamma$  counter. Receptor-ligand complexes pass quickly through the column while the free labelled VEGF passes through more slowly. The results of this experiment shown in Figure 4 demonstrate the formation of a high molecular weight complex between labelled VEGF and sVEGF-RI protein. This shows that sVEGF-RI binds VEGF.

Crosslinking - Purified sVEGF-RI (1-10ng) was added to 25  $\mu$ l of binding buffer (Dulbecco's Modified Eagle's medium (DME), 25 mM HEPES, pH 7.5, 0.3% gelatin), and  $1 \times 10^5$  cpm of [ $^{125}\text{I}$ ]-VEGF was added (Figure 6, lane 1) with either 200ng of unlabelled VEGF (lane 2) or bFGF

- 36 -

(lane 3), then incubated 2 to 16 hours at room temperature. Bis(sulfosuccinimidyl)suberate (Pierce) crosslinker was added to a final concentration of 1 mM. The reaction was stopped after 15 min by the addition of boiling SDS PAGE sample buffer. The crosslinked products were separated by SDS PAGE on a 7.5% acrylamide gel and analyzed either by autoradiography or a phosphoimager. The results are shown in Figure 6 and demonstrate that sVEGF-RI binds labelled VEGF by the appearance of two bands of about 145 kDa and 245 kDa. The 145 kDa band consists of one sVEGF-RI molecule and one VEGF molecule (Monomer, M.). The 245 kDa band apparently consists of two sVEGF-RI molecules and one VEGF dimer (D). Free VEGF ligand (L) dimers migrated at about 45 kDa.

Binding assay - The binding of sVEGF-RI to VEGF was analyzed using a 96 well plate assay as described by Duan, D-S. R. *et al.*, supra. Briefly, sVEGF-RI, 50 to 200  $\mu$ l partially purified by Mono Q chromatography (Pharmacia), was diluted to 10 ml in 25 mM TRIS, pH 7.4, 100 mM NaCl, 20 mM  $\text{NH}_4\text{HCO}_3$ . Aliquots (100  $\mu$ l) were absorbed to the surface of a 96 well plate for 18 hours at 4°C, the plates were then washed twice with blocking buffer (DME, 25 mM HEPES, pH 7.5, 0.5% gelatin) and the nonspecific sites were blocked in the same buffer for 6 hours at 4°C. The plate was then washed twice in binding buffer. Various amounts of [ $^{125}\text{I}$ ]VEGF were added to the wells in a final volume of 100  $\mu$ l/well and incubated for 2 hours at room

- 37 -

temperature. The wells were washed three times with 100  $\mu$ l of binding buffer, the bound protein was solubilized with 100  $\mu$ l of 1% SDS, 0.5% BSA and counted in a  $\gamma$  counter. The results, shown in Figure 7, were analyzed by the method of Scatchard [Scatchard, G., (1949) Ann. N.Y. Acad. Sci., 51, pp. 660-672]. The analysis demonstrates that sVEGF-RI retains high affinity binding for VEGF with a  $K_d$  value of about 20 pM. This clearly demonstrates that sVEGF-RI, lacking the transmembrane region and adjacent Ig-like domain, binds VEGF with high affinity and that these regions are not required for VEGF binding.

15

EXAMPLE 4

Inhibition of VEGF binding by sVEGF-RI - The ability of sVEGF-RI to inhibit VEGF binding to HUVECs was tested. HUVECs were plated at 50,000 cells/well in 24 well plates precoated with gelatin, and allowed to grow to confluence. A constant amount of [ $^{125}$ I]VEGF (100,000 cpm) was mixed with various amounts of partially purified sVEGF-RI in binding buffer, in a total volume of 200  $\mu$ l and preincubated at room temperature for 1 hour. Samples were added to the cells and incubated for 4 hours at 4°C with shaking. The medium was then aspirated and the cells were washed three times with binding buffer. The bound radioactivity was solubilized with 50 mM TRIS-HCl, pH 8.0, 150 mM NaCl, 1% NP40, 1% BSA and counted in a  $\gamma$  counter.

- 38 -

The results are shown in Figure 8. At the highest concentration of sVEGF-RI, VEGF binding to HUVECs was reduced by 70%. It may, however, be difficult to completely inhibit binding to the cellular membrane bound receptor since one molecule of sVEGF-R bound to a VEGF dimer may be able to bind to cell associated receptor to form an inactive (sVEGF-RI)-VEGF-(membrane spanning VEGF receptor) complex.

10

#### EXAMPLE 5

##### Inhibition of VEGF mediated mitogenesis by sVEGF-RI

Mitogenic inhibition - Since sVEGF-RI was able to inhibit VEGF binding to endothelial cells, it was then determined that the soluble receptor could inhibit VEGF induced mitogenesis in HUVECs. HUVECs were plated in gelatin coated 96 well plates at a density of 4000 cells/well in 100  $\mu$ l of DME supplemented with 10% heat inactivated fetal calf serum plus antibiotics (penicillin G, 100 units/ml; streptomycin sulfate, 100  $\mu$ g/ml). After 16 hours the medium was changed and test samples were added, cells were preincubated with a variable amount of purified sVEGF-RI for 15 minutes at 37°C before growth factor (10 ng/ml) was added. The cells were incubated for 24 hours then [methyl-<sup>3</sup>H]thymidine (0.8  $\mu$ Ci/well; 20 Ci/mmol: 1Ci = 37 GBq, final specific activity of 0.8  $\mu$ Ci/nmole) was added followed by incubated for an additional 72 hours at 37°C under 5% CO<sub>2</sub>. The cells were then washed twice with Hank's balanced salt solution adjusted to pH 7.5

- 39 -

with 25 mM Hepes, 0.1% BSA. The cells were then lysed, the DNA was solubilized with 0.2 M Na<sub>2</sub>CO<sub>3</sub>, 0.1 M NaOH, and [<sup>3</sup>H]thymidine incorporation was quantified by  
5 scintillation counting. The results are shown in Figure 9. sVEGF-RI was able to completely inhibit VEGF induced [<sup>3</sup>H]thymidine incorporation in HUVECs.

#### EXAMPLE 6

10 Purification of baculovirus expressed sVEGF-RI from Sf9 cells - Culture medium from Sf9 cells infected with a baculovirus construct designed to express sVEGF-RI (Example 2) was chromatographed through a heparin  
15 Sepharose CL-6B (Pharmacia) column (0.7 X 4 cm). The column was washed with 5 volumes of 10 mM Na-phosphate buffer, pH 6.2, 0.1 M NaCl, followed by 6 ml of 10 mM Na-phosphate buffer, pH 6.2, 0.6 M NaCl. The sVEGF-RI was eluted with 10 mM Na-phosphate buffer, pH 6.2, 1.0  
20 M NaCl. Polyacrylamide gel electrophoresis was performed which demonstrated greater than 90% purity (as judged by coomassie blue staining) of the recombinantly produced sVEGF-R (Figure 5). The identity of the protein was confirmed by N-terminal  
25 protein sequence analysis. The actual N-terminus (Ser Lys Leu ...) of the recombinant protein differs by two amino acids from that predicted by Shibuya et al., supra. (Ser-Ser-Ser...). The peptidase cleavage site in sVEGF-RI produced in Sf9 cells was between residues  
30 gly-26 and ser-27.

- 40 -

EXAMPLE 7

Construction of KDR-related sVEGF-R - Soluble forms of KDR (a known VEGF receptor) [Terman, B.I. et al., (1991) *Oncogene* 6, pp. 1677-1683; Terman, B.I. et al., (1992) *Biochem. Biophys. Res. Comm.* 187, pp. 1579-1586] may exist naturally but have not yet been identified. A soluble form of KDR is recombinantly constructed by modifying its coding sequence by PCR using the primers 1) 5' TTTTGGATCCCTGCAGACAGATCTACGTTTGAGAACC 3' (SEQ. ID. NO.: 7) and 2) 5' TTTTGGATCCTTAACGCTCTAGGACTGTGAGC 3' (SEQ. ID. NO.: 8), and pKDRA (the XhoI/EcoRI fragment coding for the extracellular and transmembrane domain of KDR cloned into the EcoRI site of pGEM 7Z obtained from Promega) as a template (Figure 17). This generated a translation stop codon after amino acid residue number 663 of KDR which corresponds to the extracellular domain of full length KDR. This modified fragment is then used to replace the PstI/BamHI fragment of pKDRA generating a truncated form of the KDR gene (Figure 10) which codes for a soluble receptor denoted sVEGF-RII (Figure 11). The XhoI site at base pair number 257 is then changed to a BamHI site by standard cloning techniques. Another truncated form of the KDR receptor is created with primer 1 shown above, and primer 3) 5' TTTTGGATCCAACGGTCCCTAGGATGATGAC 3' (SEQ. ID. NO.: 9) (Figure 12). This form of KDR, denoted sVEGF-RTMII, is truncated at the C-terminal side of the transmembrane domain and therefore retains the transmembrane region (Figure 13). A similar form of the FLT receptor is generated by PCR using the

- 41 -

primers 4) 5' AGCACCTTGGTTGTGGCTGACTC 3' (SEQ. ID. NO.: 10) and 5) 5' TTTTGGATCCTTAGATAAGGAGGGTTAATAGG 3' (SEQ. ID. NO.: 11) and plasmid pmFLT (full length flt cloned into the EcoRI site of pGEM3Z obtained from Promega) as a template (Figure 16). The 780 base pair PCR fragment can then be cloned together with the EcoRI/XbaI fragment from pmFLT to produce an EcoRI/BAMHI fragment (Figure 14) encoding a truncated form of FLT (denoted sVEGF-RTMI) which retains the transmembrane domain but lacks the cytoplasmic domain (Figure 15). The EcoRI site at the 5' end of the gene is then modified to a BamHI site. The resulting truncated forms of KDR and FLT are then cloned into pBluebac111 (Stratagene) for expression in Sf9 insect cells. Characterization of these constructed truncated forms of VEGF receptors is accomplished by the techniques used to characterize sVEGF-RI as in Examples 2, 3, 4, 5, and 6.

- 43 -

(viii) ATTORNEY/AGENT INFORMATION:

- (A) NAME: Wallen, John W.III
- (B) REGISTRATION NUMBER: 35,403
- (C) REFERENCE/DOCKET NUMBER: 18888

5

(ix) TELECOMMUNICATION INFORMATION:

- (A) TELEPHONE: (908) 594-3905
- (B) TELEFAX: (908) 594-4720

10

(2) INFORMATION FOR SEQ ID NO:1:

(i) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 20 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

15

(ii) MOLECULE TYPE: cDNA

20

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:1:

25

GCACCTTGGT TGTGGCTGAC

20

(2) INFORMATION FOR SEQ ID NO:2:

(i) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 25 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

30

- 44 -

(ii) MOLECULE TYPE: cDNA

5

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:2:

TGG AATTCGT GCTGCTTCCT GGTCC

25

10

(2) INFORMATION FOR SEQ ID NO:3:

(i) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 26 base pairs

(B) TYPE: nucleic acid

15

(C) STRANDEDNESS: single

(D) TOPOLOGY: linear

(ii) MOLECULE TYPE: cDNA

20

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:3:

GGAATTCGC GCTCACCATG GTCAGC

26

25

(2) INFORMATION FOR SEQ ID NO:4:

(i) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 27 base pairs

(B) TYPE: nucleic acid

30

(C) STRANDEDNESS: single

(D) TOPOLOGY: linear

- 45 -

(ii) MOLECULE TYPE: cDNA

5

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:4:

TTTGAATTCA CCCGGCAGGG AATGACG

WHAT IS CLAIMED IS:

1. A soluble VEGF inhibitor in substantially pure form  
5 which specifically binds VEGF and inhibits cellular VEGF  
receptor activity.

2. The soluble VEGF inhibitor according to Claim 1  
wherein the soluble VEGF receptor is selected from the  
10 group consisting of sVEGF-RI, sVEGF-RII, sVEGF-RTMI and  
sVEGF-RTMII.

3. The soluble VEGF inhibitor of Claim 2 corresponding  
to sVEGF-RI comprising the amino acid sequence:  
15

10 8. An expression vector comprising a promoter, and a  
DNA sequence encoding a soluble VEGF inhibitor for  
expression in recombinant host cells wherein the soluble  
VEGF inhibitor is selected from the group consisting of  
sVEGF-RI, sVEGF-RII, sVEGF-RTMI and sVEGF-RTMII.

15

9. The expression vector of Claim 8 wherein the DNA  
encoding the sVEGF-RI comprises the nucleotide sequence:

. (SEQ. ID. NO.: 17)

12. The expression vector of Claim 8 wherein the DNA  
15 encoding the sVEGF-RTMII comprises the nucleotide  
sequence:

- 104 -

13. A recombinant host cell containing the expression vector of Claim 8.

5 14. A method for inhibiting VEGF receptor function comprising the administration of the VEGF inhibitor of Claim 1 in an amount sufficient to inhibit VEGF receptor function.

10 15. The method of Claim 14 wherein the VEGF inhibitor is selected from the group consisting of sVEGF-RI, sVEGF-RII, sVEGF-RTMI, and sVEGF-RTMII.

15 16. A pharmaceutical composition comprising the inhibitor of Claim 1 and a pharmaceutically acceptable carrier.

20 17. The pharmaceutical composition of Claim 16 wherein the inhibitor is selected from the group consisting of sVEGF-RI, sVEGF-RII, sVEGF-RTMI, and sVEGF-RTMII.

25 18. A method for inhibiting angiogenesis comprising the administration of the VEGF inhibitor of Claim 1 in an amount sufficient to inhibit angiogenesis.

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US94/01957

## A. CLASSIFICATION OF SUBJECT MATTER

IPC(5) :C07K 13/00; C12P 21/00; C12N 5/00, 15/00

US CL :435/69.1, 240.1, 320.1; 530/350; 536/23.1

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 435/69.1, 240.1, 320.1; 530/350; 536/23.1

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

APS, Medline, Biosis, WPI

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	Journal of Cellular Physiology, Volume 149, Number 1, issued October 1991, Bikfalvi et al, "Interaction of	1
-----		-----
Y	Vasculotropin/Vascular Endothelial Cell Growth Factor with Human Umbilical Vein Endothelial Cells: Binding, Internalization, Degradation, and Biological Effects", pages 50-59, see abstract.	14, 15, 18
Y	Science, Volume 255, issued 21 February 1992, De Vries et al, "The fms-Like Tyrosine Kinase, a Receptor for Vascular endothelial Growth Factor", pages 989-991, see abstract and fig. 1.	1-18

☒ Further documents are listed in the continuation of Box C. ☐ See patent family annex.

* Special categories of cited documents:	*T	later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
*A* document defining the general state of the art which is not considered to be part of particular relevance	*X*	document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
*E* earlier document published on or after the international filing date	*Y*	document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
*L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	*G*	document member of the same patent family
*O* document referring to an oral disclosure, use, exhibition or other means		
*P* document published prior to the international filing date but later than the priority date claimed		

Date of the actual completion of the international search

12 MAY 1994

Date of mailing of the international search report

JUN 03 1994

Name and mailing address of the ISA/US  
Commissioner of Patents and Trademarks  
Box PCT  
Washington, D.C. 20231

Facsimile No. (703) 305-3230

Authorized officer

Sally P. Teng
